

The Excel add-in I wish I'd had at every project deadline.

A free ribbon tab for finance and FP&A work:
100+ one-click commands, plus a LAMBDA
library, Monte Carlo and panel charts.

Free • Open source • No sign-up

Swipe →

Every deadline, the same fights with Excel.

The macro you wrote at 11pm lives in one workbook, on one laptop.

Your best LAMBDA is buried in Name Manager, with no note of what it does.

Simulation means a paid add-in, or a model nobody else can open.

XL Edge fixes all three, **for free.**

Six tools, one tab.

Every day

Format Tools

04 →

Color-coding, number formats, clean-up.

Formula Tools

05 →

Rewrite every formula in a range at once.

Format Pivot Table

06 →

Every pivot table in the file, one click.

When you need them

LAMBDA Studio

07 →

A searchable library for your custom functions.

Monte Carlo

09 →

15 distributions as native Excel formulas.

Panel Charts

11 →

Small multiples, any grid, one native chart.

Format a model in one click.

Format Tools: 23 commands, and a keyboard shortcut for the ones you reach for most.

Financial Formatting colors each cell by what it holds

1,250

Typed-in number

=B4*C4

Formula

=Inputs!C7

Link to another sheet

=[Budget.xlsx]Plan!D9

Link to another file

=B4*1.05

Number typed into a formula

Ctrl Shift 1 steps through number formats

1,234

\$1,234

12.5%

8x

▲ 1,234

▼ (12.5%)

Ctrl Shift 2 rescales

1,234,567

1,234.6K

1.2M

Every formula in a range. **At once.**

Formula Tools: 32 commands for the edits you would otherwise make cell by cell.

Wrap with IFERROR or ROUND

=B4/C4 → =IFERROR(B4/C4,0)

Change SUM to SUBTOTAL

=SUM(D4:D9) → =SUBTOTAL(9,D4:D9)

Formulas to absolute refs

=B4*C4 → =\$B\$4*\$C\$4

Remove same-sheet refs

=Model!D4 → =D4

-
- ✓ **Ctrl** **Shift** **R** / **D** fill right or down, never over data.
 - ✓ Scale by 1,000, trim, add prefixes, fix case, fill blanks.

Every pivot table in the file. **One click.**

Format Pivot Table reads each value field's name and picks the number format to match.

Region	Revenue	Var	Var %	Margin %
North	1,284,300	▲ 87,750	7.3%	34.5%
South	942,180	▼ (36,220)	(3.7%)	32.0%
East	1,105,760	▲ 83,860	8.2%	35.5%
West	688,420	▼ (13,890)	(2.0%)	31.9%
Grand Total	4,020,660	▲ 121,500	3.1%	33.7%

Name has "Var"

green ▲, red ▼

"%", "Rate", "CAGR"

one-decimal percent

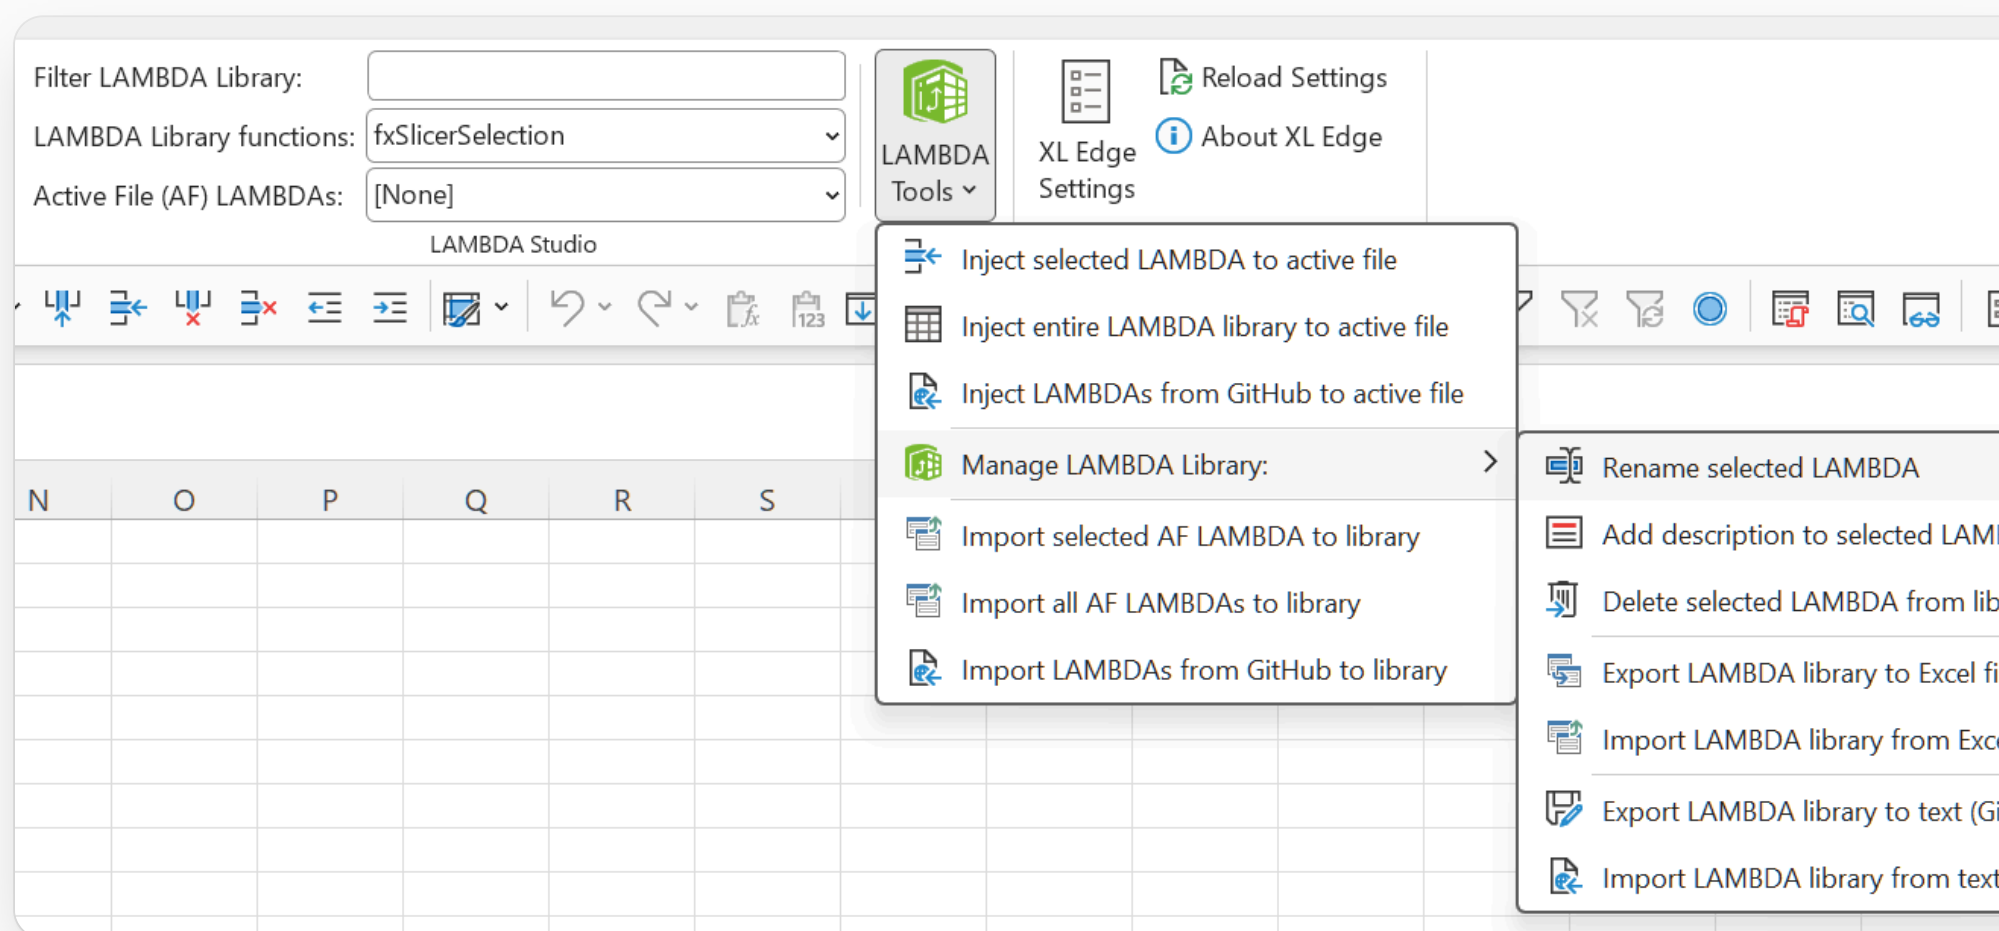

Anything else

thousands, (negatives)

Also sets tabular layout, wraps headers to one height, and keeps it all through a refresh. Sample data.

LAMBDAAs are brilliant. Managing them isn't.

They live in Name Manager, one workbook at a time, with nowhere to record what they do. LAMBDA Studio gives them a real library, right in the ribbon.

Filter the library, pick a function, inject it into the workbook you're in.

Write it once. Use it in every workbook.

Bring in from

a GitHub gist, an Excel file, or the workbook you're in

Your library

Searchable and described. Ships with 27 LAMBDAAs ready to use.

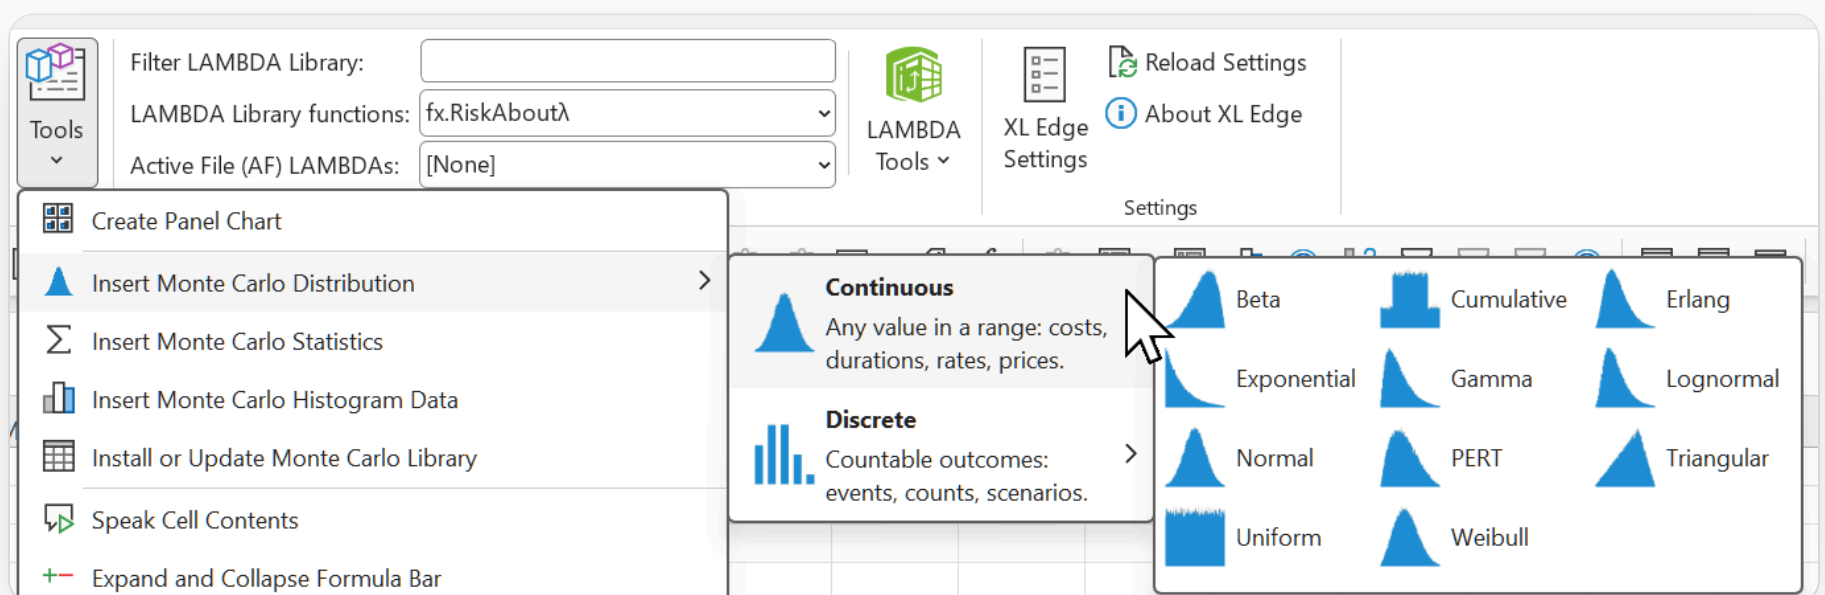

Send out to

any open workbook, an Excel file for a colleague, or gist text for GitHub

Every move is the same three fields:
name, formula, description.

Monte Carlo, **without** **the paid add-in.**

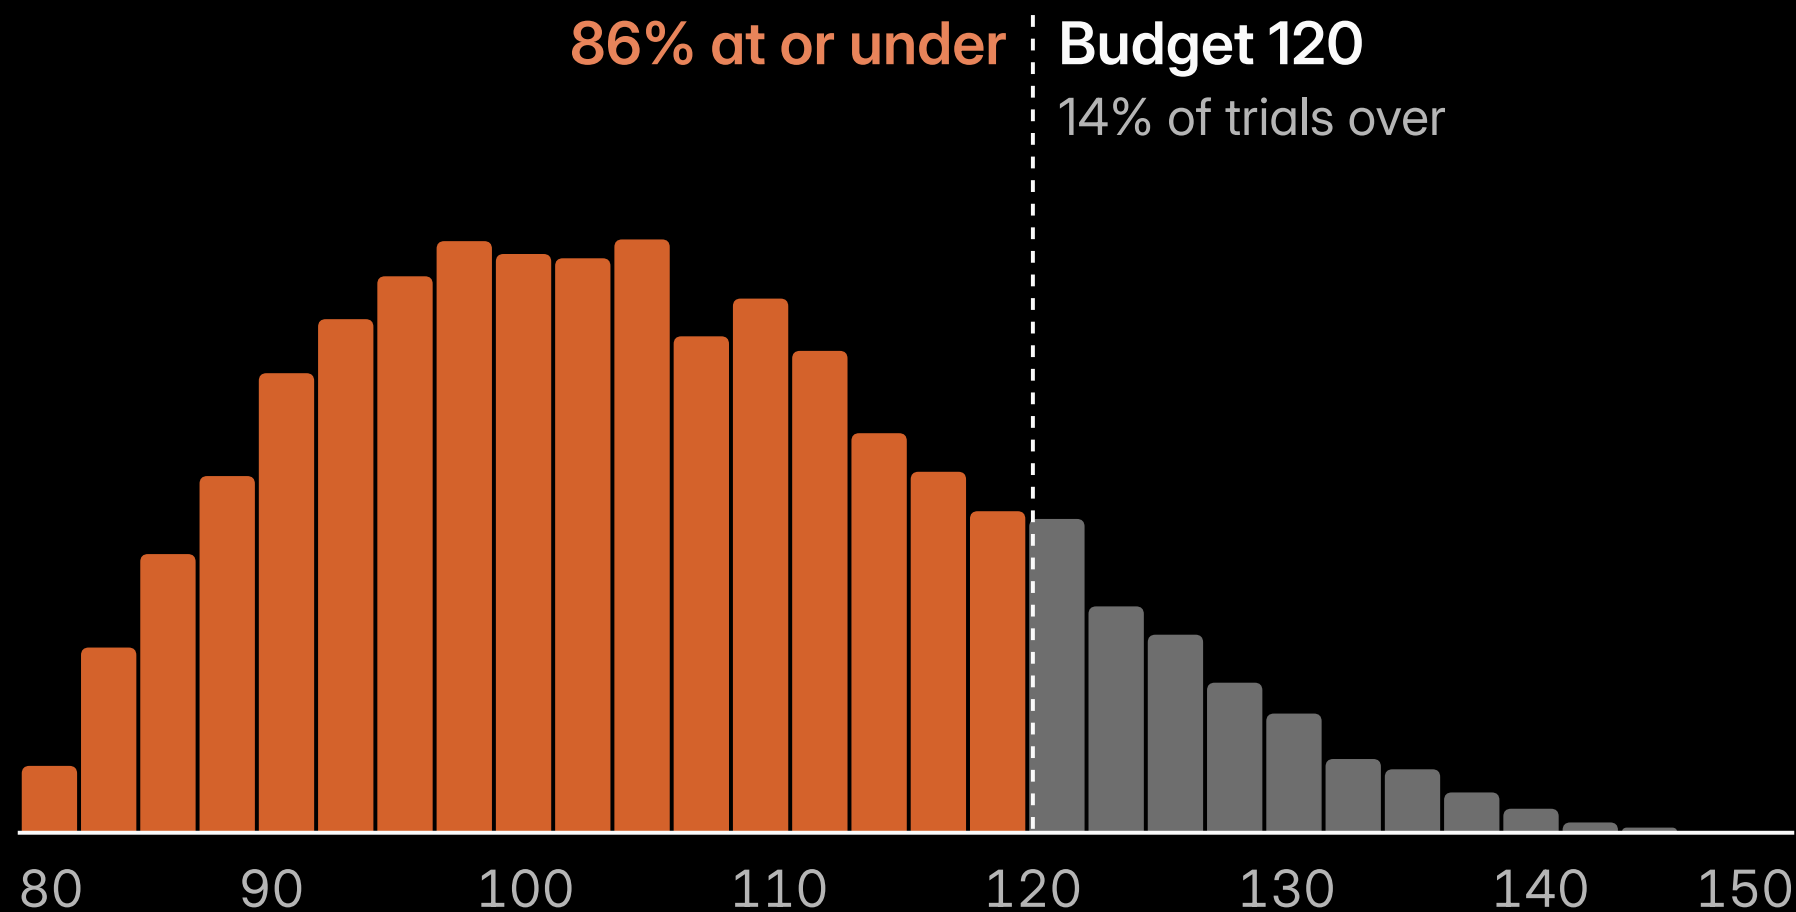

Pick from 15 distributions, answer the prompts, and XL Edge writes an ordinary LAMBDA formula into the cell.

```
=fx.RiskPertλ($C$4, $C$5, $C$6, MC_Trials, 7)
```

11 continuous and 4 discrete distributions, each with its own independent random stream.

A simulation you can hand to anyone.

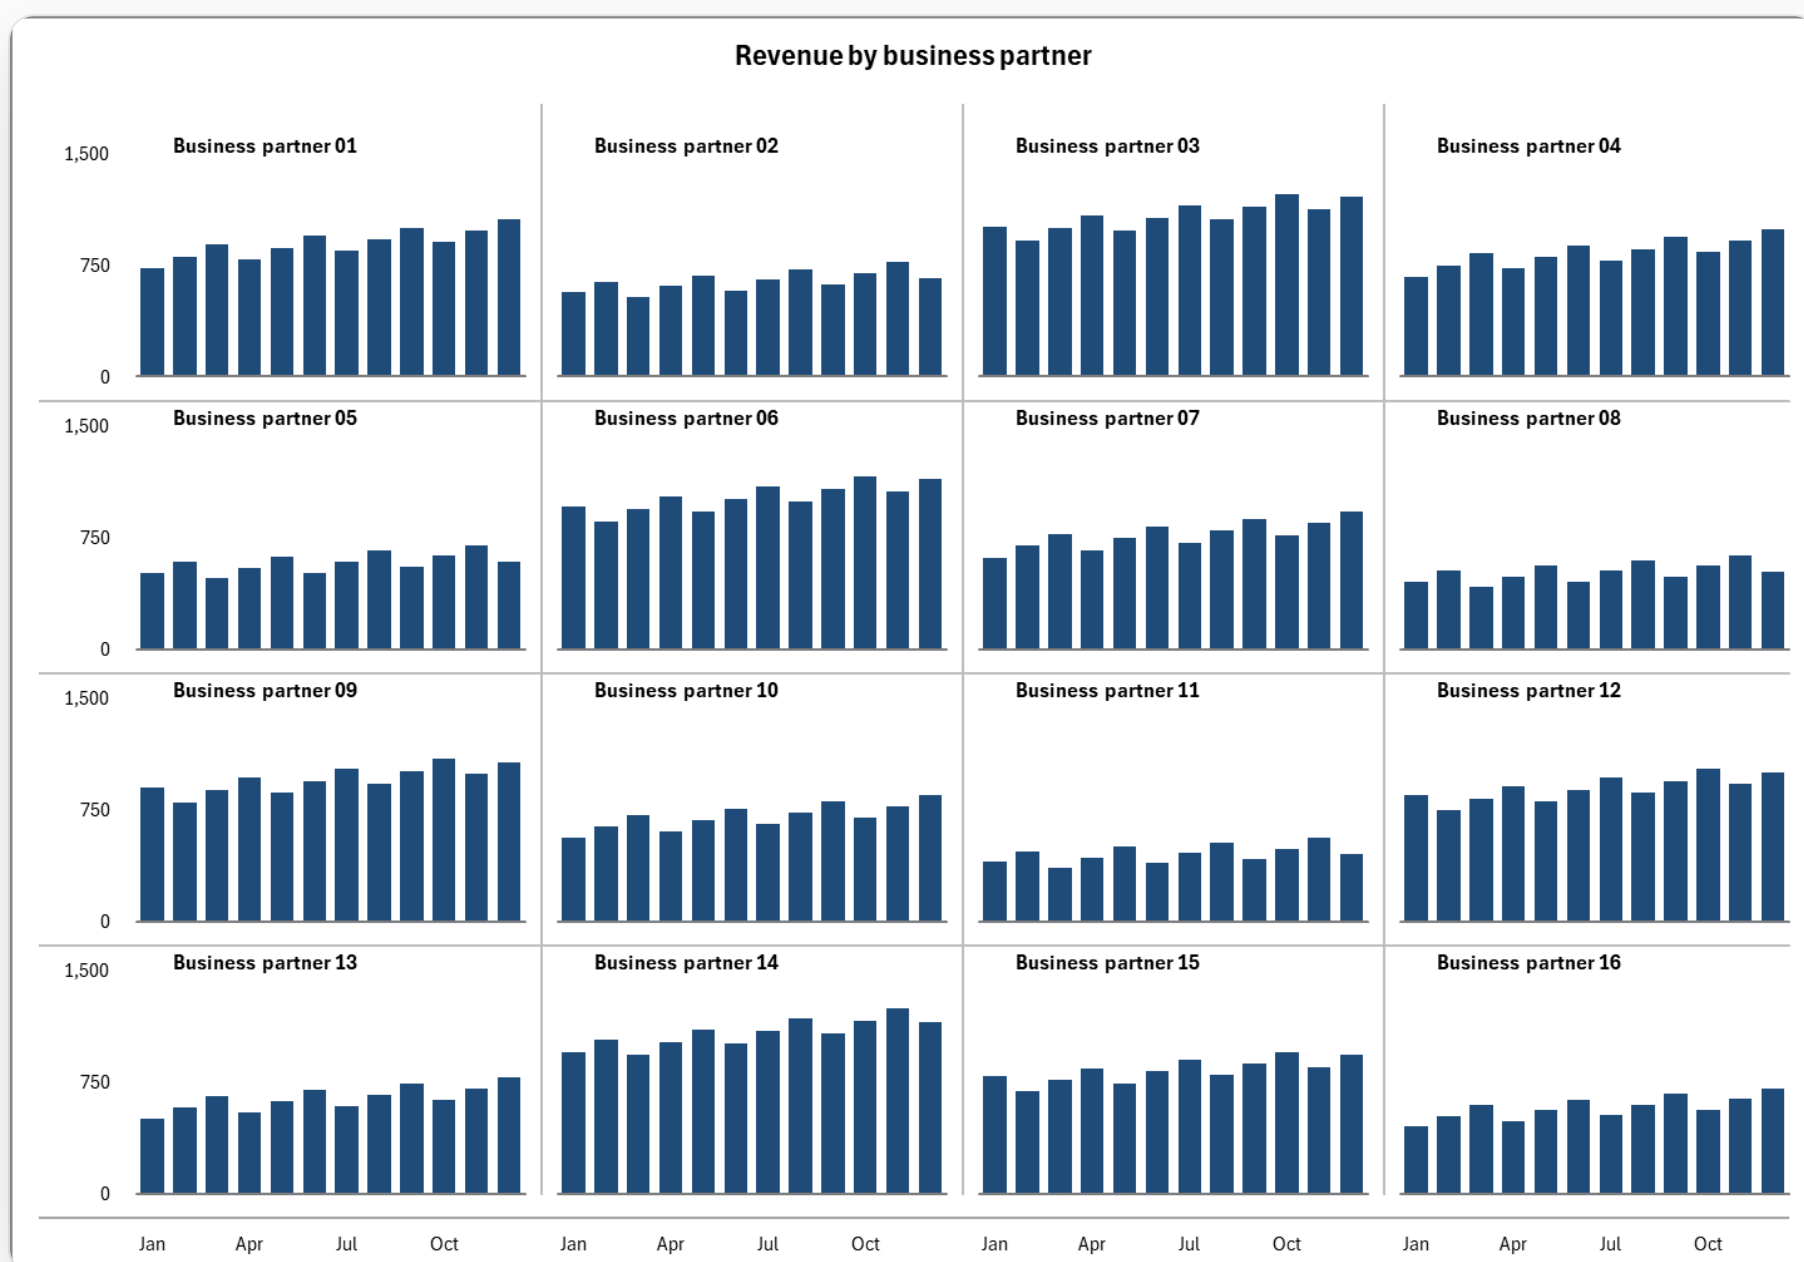

Mean	P50	P95	Trials
105.1	103.9	127.7	10,000

- ✓ One cell spills every trial.
- ✓ Seeded, so trials don't reshuffle on recalculation.
- ✓ Plain formulas: the model runs without XL Edge installed.

Real output from XL Edge's PERT function: a cost estimate of 80 / 100 / 150. Illustrative inputs.

Any grid. One scale. **One object.**

Pick the rows and columns each time you run it, up to 8×6 . It's one native chart, so the axes can't drift.

One example: a 4×4 grid, ready to print on one page. Sample data.

Rebuilt to a written standard.

Years of late-night macros, refactored with Claude Code against my own standard for speed and reliability. The refactor fixed real bugs:

- ✓ Canceling *Wrap with Round* used to write `=ROUND(..., False)`.
- ✓ Six macros forced manual calculation back to automatic.
- ✓ *Remove Negative Signs* silently wiped every formula in the selection.

```
' Cancel returns Boolean False -- the old version
' concatenated that straight into the formula
' and produced =ROUND(..., False).
v = Application.InputBox( ... , Type:=1)
If VarType(v) = vbBoolean Then Exit Sub
```

21 VBA modules • MIT license • Source on GitHub • No telemetry

Get XL Edge. It's free.

1 Download the .xlam

From edgewisedata.com, or the GitHub releases page.

2 Right-click → Properties → tick Unblock

Windows blocks macros in downloaded files. Skip this and the tab won't appear.

3 Double-click to load it

An XL Edge tab appears in the ribbon.
